No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It currently consists of 24 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence es as soon as it is available and the accession number will be preserved.

The invention is useful for identifying a modulator of GPCR and for treating a disease or condition mediated by a human protease. The invention is also useful as models for the development of human therapeutics, for identifying therapeutic proteins, as targets for development of human therapeutic agents, and as query sequence to perform a search against sequence databases to, for e.g., identify other family members of related sequences. The vector of the invention is useful for producing a GPCR protein or peptide, for conducting cell-based assays involving the GPCR protein or its fragment, for identifying GPCR protein mutants whose functions are affected, and to produce non-human transgenic coupled receptor (GPCR) gene located on chromsome 3. This sequence encodes the human G-protein coupled receptor (GPCR) gene located on chromsome 3. This sequence

                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel G protein coupled receptors (GPCRs) and CC their encoding nucleotide sequences. Many medically significant biological processes are mediated by proteins participating in signal transduction pathways involving G proteins. GPCRs are one of the largest receptor superfamilies known. These receptors are biologically important and malfunction of these receptors results in diseases such as Parkinson's, diabetes, dwarfism, colour blindness, retinal pigmentosa and asthma. They are also involved in depression, schizophrenia, sleeplessness, hypertension, anxiety, stress, renal CC schizophrenia, sleeplessness, hypertension, anxiety, stress, renal CC fallure and other cardiovascular, neural, oncology and immune disorders. A modulator of the GPCRs of the invention may have neuroprotective activity whilst the sequences of the invention may be useful for gene CC activity. The invention may also be useful for manufacturing a medicament for preventing, treating or ameliorating a medical condition. The present CC sequence is the DNA sequence encoding a human GPCR of the invention.

The invention is useful for identifying compounds that bind to it, especially agonists or antagonists. Administration of an agent (e.g. the identified agonist) that increases the expression of Mrg in a mammal may be used for treating impaired sensory perception in a mammal, especially pain. The antagonist may also be useful for treating impaired sensory perception in a mammal. The present sequence is human MrgX1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure;

The MrgD polypeptides are useful as therapeutics or for identifying compounds, i.e. agonists or antagonists, that alter pain perception in a mammal. The compounds are useful for treating impaired sensory perception, e.g. chronic intractable pain or neuropathic pain, promoting wound healing, restoring normal sensitivity following injury, or treating ocular conditions, particularly those associated with pressure such as glaucoma. The Mrg genes or proteins may be used as molecular probes for the detection of cells or tissues related to or involved with sensory perception. The present sequence represents a MrgA (Mrg subfamily) encoding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New mas-related gene D polypeptides, useful as therapeutics or identifying agonists or antagonists that alter pain perception mammal for treating impaired sensory perception, e.g. chronic pain or neuropathic pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-JUN-2002; 2002US-00183116

```
CC cardiovascular disease, disorders of the peripheral and central nervous CC cancer in a mammal. The method comprises contacting a test compound with CC Mas-related gene XI (MrgXI) polypeptide and detecting binding of the test Compound to GPR3 polypeptide, or determining MrgXI polypeptide activity CC at a certain test compound concentration (or in the absence of the test compound) and at a different concentration (or in the absence of the test compound) and at a different concentration of the test compound or at the CC presence of a compound known to be a MrgXI polypeptide regulator. Also CC described: (1) diagnosing a disease defined above in a mammal; (2) a CC pharmaceutical composition for the treatment of the disease above CC described: (1) diagnosing a disease of mrgXI polypeptide, or a therapeutic CC agent which binds to a MrgXI polypeptide or which regulates the MrgXI CC agent which binds to a MrgXI polypeptide or which regulates the MrgXI CC appleptide activity such as a small molecule, an ARNA molecule, an CC appleptide diseases. MrgXI has antianemic, cytostatic, haemostatic, CC cardiovascular, cardiant, vasotropic, antiarrhythmic, CC cardiovascular, cardiant, vasotropic, antiarrhythmic, cc cardiovascular, cardiant, vasotropic, antiarrhythmic, cc cardiovascular, antiathmatic, respiratory and nephrotropic fine compuspressive, antiathmatic, respiratory and nephrotropic fine composition of MrgXI are therapy. The regulators of MrgXI are useful for preparation of MrgXI activity in a mammal 1. They are also useful for the regulation of MrgXI activity in a mammal. They are also useful for the regulation of MrgXI activity in a mammal having the disease. The molecular biology techniques that have not yet been developed. Cm and for diagnostic purposes. The present sequence encodes human MrgXI is and for teleptor (GCRE).
G protein-coupled receptor (GPCR).

                                                                                                                                      The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the
